

Business Rules & KPI Definitions

1. Application Rules

- Each application must have a unique application ID.
- An application is in scope only when required reporting fields are present or explicitly classified by a data-quality rule.
- Decision statuses must use the approved status vocabulary: Approved, Rejected, Pending and Withdrawn.

2. Decision KPI Rules

- Approval rate uses eligible decided applications as the denominator.
- Rejection rate uses the same eligible decided population.
- Pending applications are not counted as approved or rejected.
- Withdrawn applications are reported separately unless the business owner approves another treatment.

3. Turnaround Rules

- Turnaround time is calculated from application submission timestamp to final decision timestamp.
- Applications without valid timestamps are excluded from turnaround calculations and flagged for data-quality review.
- Negative turnaround duration is treated as a data-quality exception.

4. Reporting Rules

- All dashboard KPI calculations must use documented definitions.
- Filters must affect all relevant visuals consistently.
- Monthly reporting uses the application submission date unless a specific KPI definition states otherwise.
- Aggregations must avoid double counting application IDs.

5. Governance Rules

- Changes to KPI definitions require documented change control.
- Sensitive customer information must not be exposed in the portfolio dataset.
- Requirement and rule changes must remain traceable to the applicable user stories and UAT cases.

Portfolio Disclosure

Rules are simulated for this portfolio case study and are not intended to represent any bank's actual credit policy.
