

Power BI Dashboard Specification

Banking Loan Application & Credit Risk Analytics — Simulated Portfolio Case Study (2023)

1. Objective

Create an executive and operational analytics experience that makes application volume, decisions, turnaround time and segmentation visible through consistent business definitions.

2. Page 1 — Executive Overview

KPI cards: Total Applications, Approved, Approval Rate, Rejection Rate, Pending, Average Processing Days and Median Processing Days.

Visuals: monthly trend, regional comparison, loan-type distribution, approval rate by loan type, regional turnaround and decision-status distribution.

3. Page 2 — Credit & Customer Analysis

Visuals: approval rate by credit-score band, applications by customer segment, segment decision analysis, requested amount by loan type, channel performance and credit-score distribution.

4. Page 3 — Operations & Turnaround

Visuals: processing days by stage/region, pending applications by loan type, processing-time buckets, monthly turnaround trend and data-quality exceptions.

5. Filters

Application Date, Region, Loan Type, Customer Segment, Channel and Decision Status.

6. KPI Definitions

Approval Rate = Approved Applications / Eligible Decided Applications. Rejection Rate uses the same denominator. Turnaround Time = Decision Date – Submission Date. Invalid or missing timestamps are excluded from turnaround calculations.

7. Data Model

Recommended model: application fact table plus Calendar and business dimensions for date, loan type, region, customer segment and channel. Calendar filters the fact table through application_date.

8. Design & Governance

Use consistent KPI labels, visible reporting period, controlled drill-down, documented definitions and minimum necessary application-level detail. Apply role-based access requirements where implemented.

9. Validation Checklist

- Reconcile total application count to source data.
- Validate approval/rejection denominators.
- Test every slicer against KPI cards and visuals.
- Validate turnaround calculations.
- Test drill-down and page navigation.
- Validate data-quality exception counts.

Portfolio Disclosure

This is a dashboard specification, not a claimed production Power BI deployment. The underlying data is synthetic and the credit analysis is descriptive.
