

AS-IS / TO-BE Process Analysis & Gap Analysis

Banking Loan Application & Credit Risk Analytics — Simulated Portfolio Case Study (2023)

1. Analysis Objective

Analyze the current loan application lifecycle, identify process and reporting gaps, and define a target-state workflow that improves visibility, standardization and turnaround-time monitoring.

2. AS-IS Process

- Customer submits loan application through branch, sales or digital channel.
- Application data is captured and documents are collected.
- Operations team performs initial completeness checks.
- Credit team reviews eligibility and supporting information.
- Credit decision is recorded as approved, rejected or pending.
- Operations updates the application status and communicates the outcome.
- Management reporting is prepared from operational records and manual extracts.

3. AS-IS Pain Points

- Manual consolidation can create inconsistent reporting periods and definitions.
- Limited stage-level visibility makes bottlenecks difficult to isolate.
- Different teams may interpret approval and rejection KPIs differently.
- Turnaround time is difficult to monitor consistently when timestamps are incomplete.
- Management lacks a single analytical view across loan type, region and customer segment.

4. AS-IS Process Flow

Application Submission → Data & Document Capture → Completeness Check → Credit Assessment → Decision → Status Update → Manual Reporting

5. TO-BE Process

- Capture a standardized application record with a unique application ID.
- Validate mandatory fields and flag data-quality exceptions.
- Track timestamps for major lifecycle stages.
- Apply documented business rules for status and KPI calculations.
- Load validated data into the analytical reporting layer.
- Provide interactive management dashboards with consistent filters and KPI definitions.
- Use UAT and change control to validate future reporting changes.

6. TO-BE Process Flow

Application → Standardized Capture → Data Validation → Credit Assessment → Decision → Analytical Data Layer → KPI Calculation → Power BI Dashboard → Management Action

7. Gap Analysis

Gap ID	Current State	Target State	BA / Solution Response
G-001	Manual reporting consolidation	Centralized analytical dataset	Define data model and reporting requirements
G-002	Inconsistent KPI definitions	Documented business rules	Create KPI and business-rule specification
G-003	Limited stage visibility	Stage timestamps and monitoring	Add turnaround and bottleneck requirements
G-004	Limited segmentation	Loan / region / customer analysis	Define analytical dimensions
G-005	Manual management reporting	Interactive dashboard	Create Power BI dashboard specification
G-006	Changes handled informally	Controlled change process	Maintain change request and impact log
G-007	Testing not consistently traceable	Requirement-to-UAT traceability	Create RTM and UAT scenarios

8. Target-State Controls

- Unique application identifier prevents duplicate counting.
- Mandatory-field validation improves analytical data quality.
- Documented KPI formulas establish a common reporting language.
- Stage timestamps support turnaround-time analysis.
- Role-based access requirements protect sensitive reporting.
- Traceability links business needs to requirements, user stories and UAT.

9. BA Deliverables Produced From This Analysis

- AS-IS process description
- TO-BE process description
- Gap register
- Target-state controls
- Functional requirements
- User stories
- Dashboard requirements
- UAT scenarios
- Change-control requirements

10. Validation Questions

- Does the AS-IS flow reflect the agreed business process?
- Are all major handoffs represented?
- Are bottlenecks measurable using available data?
- Are TO-BE controls feasible for the business and technical teams?
- Do requirements and UAT cases address the identified gaps?

11. Portfolio Disclosure

This process analysis is simulated and illustrative. It demonstrates a BA method for process discovery and improvement and should not be presented as a real bank production process.
