

Change Management Documentation

Banking Loan Application & Credit Risk Analytics — Simulated Portfolio Project | 2023

1. Purpose

Define a controlled approach for capturing, assessing, approving, implementing, validating and closing changes to requirements, analytics, dashboards and supporting documentation.

2. Why Change Management Matters

Analytics projects can change after stakeholder review. A Business Analyst should protect scope clarity and traceability by documenting the requested change, business reason, impacted requirements, data/process/reporting effects, UAT impact, decision and final disposition.

3. Change Workflow

Raise request → Triage → Impact assessment → Approval → Implementation → Validation → Closure and communication.

4. Change Request Examples

ID	Change	Impact	Priority	Status
CR-001	Add branch-level performance view	Medium	Medium	Approved for analysis design
CR-002	Add channel performance analysis	Low	Medium	Approved
CR-003	Add pending-age buckets	Medium	High	Approved for dashboard design
CR-004	Add data-quality exception page	Medium	High	Approved
CR-005	Change approval-rate denominator	High	High	Approved as KPI definition
CR-006	Add requested-amount analysis	Low	Medium	Approved
CR-007	Add exportable management table	Medium	Medium	Under review
CR-008	Add automated refresh monitoring	Medium	High	Under review

5. Impact Assessment Areas

- Requirements: identify affected BRD/FRD/user stories and baseline changes.
- Process: identify changes to AS-IS/TO-BE flows or operational responsibilities.
- Data: identify new fields, transformations, quality rules or source dependencies.
- Reporting: identify affected KPIs, visuals, filters, calculations and model relationships.
- UAT: identify new or changed test cases and regression scenarios.
- Documentation: update requirements, data dictionary, dashboard specification, README and training/operating notes as applicable.

6. Change Control Principles

- Every material change receives a unique change ID.
- KPI definition changes are explicitly documented because they can alter reported results.
- Approved changes update traceability and affected UAT coverage.
- Rejected/deferred changes remain recorded with the decision and rationale.
- Implementation is separated from approval so scope changes are controlled.

7. BA Interview Talking Point

"I manage scope changes through a change-request log. I capture the business reason, assess impact across requirements, process, data, reporting, UAT and documentation, then route the request for approval. Once approved, I update the affected artifacts and traceability, coordinate validation and close the change with evidence."

8. Portfolio Disclosure

This is a simulated/illustrative portfolio project. The change requests are realistic examples created for Business Analyst learning, GitHub presentation and interview preparation; they are not claims about changes made for a real bank or customer.
