

Final Recommendations & Project Closure

Banking Loan Application & Credit Risk Analytics — Simulated Portfolio Project | 2023

1. Executive Summary

The project establishes a structured analytics approach for understanding banking loan applications, decisions, turnaround time, segmentation and data quality. The analysis design combines business requirements, process analysis, SQL, Excel and a Power BI reporting specification, with UAT and change-management controls.

2. Key Business Findings

- Management reporting should use standardized KPI definitions so approval, rejection and turnaround metrics are interpreted consistently.
- Application volume and decision outcomes should be monitored by reporting period, region, loan type, customer segment and channel.
- Pending applications should be monitored separately, including ageing, rather than being mixed into approval-rate calculations.
- Turnaround time should be reviewed using both average and median measures and segmented by operational dimensions.
- Data-quality exceptions should be visible because incomplete or invalid dates and fields can affect analytical accuracy.

3. Recommendations

ID	Recommendation	Priority
REC-001	Standardize KPI definitions and ownership	High
REC-002	Automate management reporting through Power BI	High
REC-003	Monitor pending application ageing	High
REC-004	Introduce data-quality exception monitoring	High
REC-005	Use regional, loan-type and customer-segment drilldowns	Medium
REC-006	Maintain requirements-to-UAT traceability	Medium

4. Expected Business Impact

- More consistent management reporting through common KPI definitions.
- Less recurring manual effort when reporting is automated.
- Faster visibility into pending and ageing applications.
- Improved confidence in dashboard results through explicit data-quality checks.
- Better root-cause analysis through controlled segmentation and drilldowns.
- Stronger auditability through requirements, UAT and change traceability.

5. Lessons Learned

- Define business terms and KPI formulas before building visuals.
- Treat data quality as a requirement, not only a technical cleanup activity.
- Use AS-IS/TO-BE analysis to connect business problems to analytical solutions.
- Maintain traceability so requirement changes can be reflected in UAT and reporting.
- Separate documented design from executed implementation and testing evidence.

6. Project Closure Checklist

Area	Closure Status
Charter / Stakeholders	Complete
Requirements / Business Rules	Complete
Process / Gap Analysis	Complete
User Stories / RTM	Complete
Data / SQL / Data Dictionary	Complete
Excel Analysis	Complete
Power BI Design Package	Specification Complete
UAT	Prepared — execution not claimed
Change Management	Complete
Recommendations / Lessons Learned	Complete

7. BA Interview Talking Points

- “I started with the business problem and converted it into measurable requirements and KPIs.”
- “I mapped the current process, identified reporting and visibility gaps, and designed a target-state analytical flow.”
- “I maintained traceability from business requirements through functional requirements, user stories and UAT.”
- “I used SQL and Excel for analysis and created a Power BI implementation specification with DAX and a dimensional model.”
- “For changes, I assessed impact on requirements, data, reporting, UAT and documentation before approval.”

8. Portfolio Disclosure

This project is simulated/illustrative and was created for Business Analyst learning, GitHub portfolio presentation and interview preparation. The dataset and project artifacts do not represent confidential bank data, real customer

information, or evidence of work performed for a real organization. Power BI and UAT sections distinguish planned/design work from execution.
